the study of angles and triangles

The Tangent Ratio

We name the sides of right triangles in relation to one of its acute angles

length of side opposite $\angle A$: length of side adjacent $\angle A$

$$o : a$$

as a fraction $\Rightarrow \frac{o}{a}$

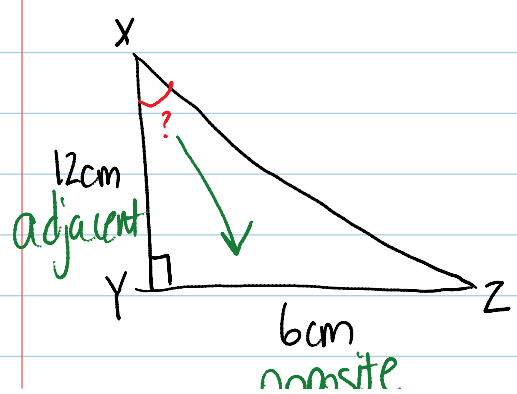

This ratio is called the tangent ratio of $\angle A$

$$\tan \angle A = \frac{o}{a}$$

this # refers to the degrees in the angle

Ex. #1

Calculate $\tan x$

make sure your calculator is in degree mode !!

$$\tan x = \frac{\text{opposite}}{\text{adjacent}}$$

6cm
opposite

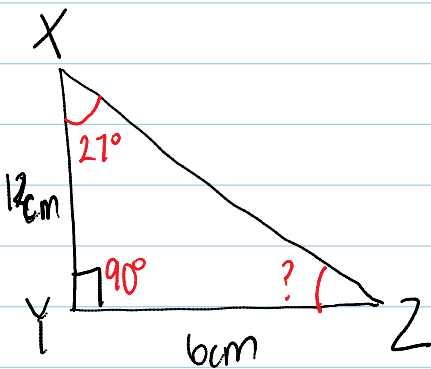

adjacent

$$\tan x = \frac{6}{12}$$

$$\tan x = 0.5 \quad \text{Ratio!}$$

convert decimal to degrees

$$\tan^{-1}(0.5) = 26.6 \approx \boxed{27^\circ}$$

2 methods

$$\tan Z = \frac{12}{6}$$

$$\tan Z = 2$$

$$\tan Z = 2$$

$$\begin{aligned} \tan^{-1}(2) &= \angle Z \\ &= 63.43^\circ \\ &\approx \boxed{63^\circ} \end{aligned}$$

Sum of a triangle
is 180°

$$27^\circ + 90^\circ$$

$$180 - 27 - 90$$

$$= \boxed{63^\circ}$$
