

8.1 Properties of Tangents to a Circle

June 5, 2015 3:22 PM

RECALL

sum of a triangle

$$a + b + c = 180^\circ$$

Pythagorean Theorem

$$a^2 + b^2 = c^2$$

Ex. #1

$$\angle X \Rightarrow 90 + 60 = \overset{180}{150}$$

$$\boxed{30^\circ}$$

$$a^2 + b^2 = c^2$$

$$a^2 + 7^2 = 8^2$$

$$a^2 + 49 = 64$$

$$\begin{array}{r} -49 \\ \hline \end{array} \quad \begin{array}{r} -49 \\ \hline \end{array}$$

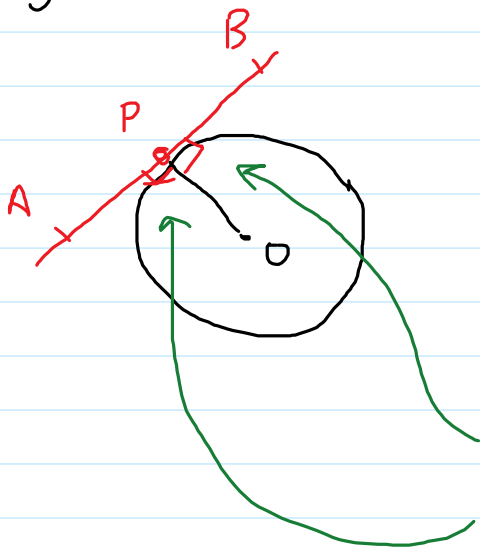

$$\sqrt{a^2} = \sqrt{15}$$

$$a = \boxed{3.87 \text{ cm}}$$

A tangent touches a circle at exactly 1 point

Tangent Radius Property

A tangent to a circle is perpendicular to the radius drawn to the point of tangency

So $OP \perp AB$

$$\angle OPA = 90^\circ$$

$$\angle OPB = 90^\circ$$

Ex #1

Find the measure of x°

BP is tangent to the circle at P
O is the centre of the circle

$$90 + 50 = \frac{180}{40^\circ}$$

Ex. #2

MB is tangent to the circle at B
O is the centre
Find the length of the radius OB (r)

$$\begin{aligned} a^2 + b^2 &= c^2 \\ a^2 + 8^2 &= 10^2 \\ a^2 + 64 &= 100 \\ -64 & \quad -64 \\ \hline a^2 &= 36 \\ \sqrt{\quad} & \quad \sqrt{\quad} \end{aligned}$$

$$\frac{-64}{-64}$$
$$\sqrt{a^2} = \sqrt{36}$$

$$a = 6$$
